

## **Title**

### **Employee Attendance Dashboard Using Power BI**

#### **1. Introduction**

Organizations generate attendance data every day, making it difficult to monitor employee presence, work-from-home patterns, and leave records manually. Power BI provides an effective solution for transforming raw attendance data into interactive dashboards that help management make informed decisions.

This project develops an Employee Attendance Dashboard using Microsoft Power BI. The dashboard visualizes key attendance metrics such as Presence Percentage, Work From Home (WFH) Percentage, and Sick Leave (SL) Percentage through interactive charts, tables, and KPI cards.

#### **2. Objectives**

- To analyze employee attendance records.
- To calculate overall Presence, WFH, and Sick Leave percentages.
- To monitor attendance trends over time.
- To compare attendance performance among employees.
- To provide an interactive dashboard for management.

#### **3. Tools Used**

| <b>Tool</b>                              | <b>Purpose</b>                   |
|------------------------------------------|----------------------------------|
| Microsoft Power BI Dashboard Development |                                  |
| Power Query                              | Data Cleaning and Transformation |
| DAX                                      | Calculated Measures              |
| Excel Dataset                            | Attendance Data Source           |

#### **4. Dataset Description**

The dataset contains employee attendance information with the following fields:

- Employee Name
- Date

- Month
- Day of Week
- Attendance Status
- Presence %
- Work From Home %
- Sick Leave %

The data is cleaned and transformed using Power Query before visualization.

## **5. Dashboard Components**

### **a) KPI Cards**

The dashboard displays three important KPIs:

- Presence %
- Work From Home %
- Sick Leave %

These cards provide an instant overview of overall attendance performance.

### **b) Month Slicer**

A Month slicer allows users to filter attendance information for a selected month, making the dashboard interactive.

### **c) Employee Attendance Table**

Displays:

- Employee Name
- Presence %
- WFH %
- Sick Leave %

This helps compare employee attendance performance.

### **d) Attendance Matrix**

Shows employee attendance status for every date, enabling detailed tracking of daily attendance.

### **e) Attendance Trend Charts**

Three Area Charts visualize:

- Presence % by Date
- WFH % by Date
- Sick Leave % by Date

These charts help identify attendance trends over time.

### **f) Day-wise Analysis**

Separate tables display:

- Presence % by Day of Week
- WFH % by Day of Week
- Sick Leave % by Day of Week

This helps identify attendance patterns across weekdays.

## **6. Features of the Dashboard**

- Interactive Month Filter
- Dynamic KPI Cards
- Employee Performance Comparison
- Date-wise Attendance Monitoring
- Day-wise Attendance Analysis
- Easy-to-understand Visualizations
- User-friendly Dashboard Layout

## **7. Benefits**

- Reduces manual attendance analysis.
- Provides quick insights into employee attendance.

- Helps HR monitor attendance trends.
- Supports better workforce planning.
- Enables faster decision-making.

## **8. Learning Outcomes**

Through this project, I learned:

- Importing data into Power BI
- Data transformation using Power Query
- Creating DAX measures
- Designing interactive dashboards
- Using KPI Cards, Tables, Matrix, Area Charts, and Slicers
- Building business intelligence reports

## **9. Conclusion**

The Employee Attendance Dashboard successfully transforms attendance data into meaningful visual insights. By using Power BI's interactive features, users can monitor employee attendance, Work From Home trends, and Sick Leave percentages efficiently. The dashboard improves data analysis, supports informed decision-making, and demonstrates the practical application of business intelligence in workforce management.
